### Company profile and contribution to the COTEMACO project:

QING is an innovative partner to production companies. We help companies with automation projects and optimization projects. Cost reduction, output increase, or quality control are most of the goals when starting a project in this area. We use innovative tools and a creative, open structure to test what the best solution to a problem statement is.

Using our own lab to perform tests, in for example cardboard, we can verify principles at low costs, before investing in engineering hours.

Possible solutions to a problem could be the development of a task dedicated system or for example implementing a robotic systems. All the projects we do are different, throughout the years this has given us a wide view of available technologies. 70-80% of the completed projects are in the field of food, food processing and food packaging, which might come in handy with the COTEMACO project.

Keywords for QING are: Innovating, involved, flexible, independent (as well in applying technologies as in thinking), efficient, and out-of-the-box.

Offering to the COTEMACO project:

QING will provide COTEMACO with a Digital Twin of a demonstrator. This is a simulation of another demonstrator. The goal of this offering is showing food processors how feasibility and financial risks can be cut through applying innovative tools to test an solution before building it.
