Company profile and contribution to the COTEMACO project:

I have experience as a concept engineer for a big robot automation company. There I learned, to make a concept out of a demand. In addition I had to write a technical description and make a calculation before handing it over to Project management. As industrial automation evolved, so came the cobots, something I am very interested in and know a lot about. I can offer consultancy in an accessible manner. My method is to understand the desires and wishes of a customer and translate it into a basic proposal, including an estimation of price. In this way the customer can receive an estimation of their wishes within a week. I do not like a lot of documentation, so will not deliver a lot. When asked for, I can expand my delivery with a more detailed work.

What I can do for COTEMACO:

- I can give a basic educational presentation in Cobots.
- I can give consultancy in purchasing a cobot installation.
- I can turn determine a price and solution to any cobot relating wish.
